

INDUSTRIAL TRAINING REPORT

INTRODUCTION

This report details my industrial training (IT) experience at Ejeh Information Technology, with a focus on the company's structure, training activities, and the skills I acquired. Industrial training serves as a bridge between theoretical knowledge and real-world practical experience, equipping students with industry-relevant skills and insights into professional practices.

DESCRIPTION OF THE ORGANIZATION

Name and Location

The IT training was conducted at **Ejeh Information Technology**, located along Abacha Road in Nasarawa State, Nigeria. The organization shares a boundary with Abuja, the Federal Capital Territory (FCT).

Nature of Business

Ejeh Information Technology offers various tech-related services including: - Web development - 3D modeling - Data analysis - Sale and repair of laptops and computer accessories - Tech training in the above fields

Background and Relevance

Founded in 2019, Ejeh Information Technology has built a solid reputation in the local tech ecosystem. The company has successfully delivered IT solutions to a wide range of businesses, developing websites for companies such as **ejehtech.com**, **fabolatch.com.ng**, and **domino.com**.

ORGANIZATIONAL STRUCTURE (ORGANOGRAM)

The organizational structure of Ejeh Information Technology is relatively flat but functional, consisting of the following roles:

1. **Director/CEO** – Oversees the entire organization, supervises project delivery, and provides direct training in advanced technologies like JavaScript and PHP.
2. **Senior Developers** – Experienced staff members who handle client projects and train IT students in foundational technologies like HTML and CSS.
3. **IT Trainees** – Students undergoing training in various tech skills.
4. **Technical Support/Repair Unit** – Handles hardware sales and repairs.

The Director directly interacts with clients during project negotiations, delegates tasks to the senior developers, and ensures that final deliverables meet the client's requirements.

COMPREHENSIVE DESCRIPTION OF ACTIVITIES UNDERTAKEN

During the IT period, I enrolled in the **Web Development Program**, which officially held classes on **Tuesdays, Thursdays, and Saturdays**, although we were allowed to visit the office for additional personal practice on any day.

Training Breakdown: - **HTML:** Introduction to tags, text formatting, lists, tables, forms. - **CSS:** Styling techniques, selectors, positioning, responsiveness, media queries. - **JavaScript:** DOM manipulation, functions, control structures, introductory AJAX. - **PHP:** Variables, data types, control statements, loops, forms, file handling, and database interaction.

The training was progressive and hands-on. HTML and CSS were taught by a senior developer (a former IT trainee), while the Director handled JavaScript and PHP. After the structured 2-month introductory training, I began exploring **Python**, a language I had prior exposure to, which helped strengthen my understanding of programming fundamentals like variables, data types, conditionals, and loops.

Example of Python Use: I practiced creating simple applications such as a basic calculator and a student grading system using if-else statements and functions. Tools like **ChatGPT** provided contextual examples and explanations that enhanced my learning experience.

SKILLS ACQUIRED

• Web Development:

- Proficient in HTML for webpage structuring
- Strong understanding of CSS for styling and responsive design
- Practical knowledge of PHP and how it integrates with HTML to build dynamic websites
- Exposure to JavaScript and its real-world applications (e.g., DOM manipulation)

• Database Management:

- Learned basic CRUD (Create, Read, Update, Delete) operations in PHP
- Created and managed MySQL databases for PHP projects

• Other Skills:

- Brief exposure to data analysis tools
- Improved troubleshooting and problem-solving skills

TECHNICAL CHALLENGES ENCOUNTERED

While I did not face major technical issues, I encountered the following challenges: 1. **Hardware Issues:** My laptop's power cord got damaged, and I experienced lag due to the HDD's slow speed. 2. **Software Learning Curve:** Understanding JavaScript concepts such as the DOM and AJAX initially proved difficult.

HOW CHALLENGES WERE MANAGED

- I replaced my laptop's HDD with an SSD, significantly improving performance during project development.
- I committed additional hours to learning JavaScript, watched tutorials, practiced consistently, and sought help from my trainers. With time and effort, I overcame the steep learning curve and gained solid proficiency.

CONCLUSION AND RECOMMENDATIONS

Summary of Experience

My industrial training at Ejeh Information Technology was a transformative experience. I gained hands-on skills in web development, improved my understanding of core programming concepts, and developed greater confidence in building web-based solutions. The learning environment was friendly and supportive, making the process both enjoyable and educational.

Recommendations for Prospective Students

- Approach the IT period with seriousness and consistency - Be prepared to learn independently outside scheduled class hours - Have a functional laptop and ensure your system is fast enough to handle modern development tools - Use online resources like ChatGPT and YouTube to reinforce learning

Recommendations to Authorities

- Improve the structure and monitoring of the IT programs to ensure students are placed in relevant and active tech organizations - Provide stipends or basic support for students to upgrade necessary hardware tools
